

File Handling

Lecture 8

Q1. An input file contains the data in the following format, Create a function in C++ to read the data in an integer array. Create a Function to display the value read from the file on screen.

Input.txt:

12 13 14 15 18 90 76

Q2. An input file contains the data in the following format, Create a function in C++ to read the data in a floating array. Create a Function to display the value read from the file on screen.

Input.txt:

12.5,13.8,14.5,15

Q3. An input file contains the data in the following format, Create a function in C++ to read the values in integer array. Create a Function to display the value read from the file on screen.

Input.txt

a 100
b 20
c 456
d 789

Q4. An input file contains the data in the following format, Create a function in C++ to read the values in integer array. Create a Function to display the value read from the file on screen.

Input.txt

A=100
B=20
c=456
d=789

Q5. An input file contains the data in the following format. Create a function in C++ to read roll no, name and marks in separate arrays. Create another function to display the name of students whose marks are above 80.
